DIGESTIVE AID

- Digestive Aid promotes health in all of the digestive organs (stomach, small intestine, pancreas, gallbladder and liver).
- Is especially beneficial for those who are too busy to eat daily portions of fresh, raw vegetables and fruits.
The body uses enzymes to break down cysts, growths and tumors that can become serious threats if left unattended.
- Signs of enzyme weakness: Crow's feet, longitudinal lines on the fingernails, teeth imprints around edge of tongue, brain fog.
- If you do not have a well-defined line where your lips meet your face, you have a history of enzyme (raw food) deficiency.
Suggested Use: Take one or two capsules of Digestive Aid with your food. You may take more as needed with meals that include meat, fried foods, processed foods or foods which do not agree with you (cause indigestion, mucus build-up, throat clearing, etc).

Carry **Digestive Aid** with you throughout the day in your purse or pocket because enzymes work best when supplied with your meal. If you forget to take them with you, take them when you get home. Enzymes are especially needed with your largest meal and with meals that contain foods deficient in enzymes. This includes any food that is cooked, particularly meats, dairy, fried foods and processed foods.
